PROFESSIONAL SUMMARY

Motivated Computer Science student with hands-on experience in front-end development, UI design, and collaborative software projects. Skilled in multiple programming languages and frameworks, with a strong foundation in algorithms, data structures, and web development. Experienced in building responsive, accessible web applications and contributing to team-based projects. Eager to apply technical expertise and creativity to real-world challenges while continuing to grow as a software engineer.

EDUCATION

San Francisco State University

San Francisco, CA

Bachelor of Science in Computer Science

Expected

8/2026

Coursework: Analysis of Algorithms, Data Structures, Discrete Math, **Analysis of Algorithms**, Operating Systems, Programming Methodology, Web Software Development

PROJECTS

BoomBots | Java | JavaFX / Swing | OOP | UML

06/2025 –

08/2025

Designed and implemented a 2D tank battle game using Java, following modern game development patterns.

- Created a UML diagram for architectural planning, ensuring scalability and maintainability.
- Utilized object-oriented programming principles, including interfaces and inheritance, to enhance game flexibility.
- Integrated collision detection and AI-based enemy movement, improving game-play mechanics and user engagement.

• Game Mechanics Implementation

The core gameplay features — tank movement, shooting, collision detection, and health tracking — worked smoothly by the end of development. The logic for bullet collisions and player interactions was successfully integrated without major bugs.

• Object-Oriented Design

We maintained a clean object-oriented structure, with separate classes for Tank, GameWorld, PowerUp, and Bullet. This made the code easier to debug and extend later (e.g., adding new power-ups or UI elements).

• Visual and UI Improvements

The addition of health bars, explosion animations, and a mini-map helped make the game more engaging and visually clear for players. The split-screen view worked well for multiplayer gameplay.

• Testing and Debugging

Our debugging process went well, especially when testing collisions and player movement boundaries. Using print statements and incremental testing helped quickly identify logic errors.

• Teamwork During Integration

The final integration of all modules (graphics, audio, controls, and game logic) came together smoothly near the deadline, with only minor adjustments needed for rendering and synchronization.

• Learning and Skill Growth

Everyone gained more experience in Java, OOP design, and working with a real game loop structure. This project helped us understand how object interactions, rendering cycles, and input handling work together in a complete system.

Programming Languages:

- **Java** – The main programming language used to build the entire game, including gameplay logic, physics, and rendering.
- **JavaFX / Swing** – Used for rendering graphics, UI components, and handling keyboard input.
- **XML / JSON** (optional, if used for assets or configuration) – Used for storing level data, configuration settings, or object properties.

Development Tools & Frameworks:

- **IntelliJ IDEA / VS Code** – Used as the main IDE for coding and testing the project.
- **Git & GitHub** – Used for version control and collaboration between team members.
- **Gradle / Maven** (if applicable) – For project building and dependency management.

Game Assets & Libraries:

- **Java AWT / Graphics2D** – For rendering images, drawing tanks, projectiles, and maps.
- **AudioClip / JavaFX Media** – To implement sound effects and background music.

Project Highlights & Outcomes:

- Successfully built a two-player 2D tank game with stable core mechanics, including movement, shooting, power-up collection, collision detection, and life tracking.
- Applied object-oriented design and UML planning to create a clean, maintainable, and scalable codebase, resulting in smooth gameplay and balanced player interactions.
- Implemented modular classes for tanks, projectiles, power-ups, and game state management, improving extensibility and debugging efficiency.

SKILLS

Technologies: Java, Python, C++, JavaScript, Ruby, SQL, HTML, CSS, JavaScript, MySQL, GitHub; Microsoft Office Suite (Word, Excel, PowerPoint, Outlook), Google Workspace (Google Docs, Sheets, Slides, Gmail, Google Drive), Zoom

Languages: English, Spanish and French

WORK EXPERIENCE

Howe Neat, Inc.

San Francisco, CA

Girls Who Code - Software Engineering Internship

06/2021 – 08/2021

- Involve in coding and programming, contributing to the development of applications and improving skills in software engineering and application design

- Apply debugging and testing techniques to ensure the reliability and functionality of code, demonstrating a commitment to delivering high-quality software
- Collaborate with senior leaders, and participated in researching, investigating, and fixing a diverse range of technical issues, highlighting a problem-solving mindset

Hayes and Co.

Santa Clara, CA

Front-End Intern software Engineer Intern

01/2022 – 07/2025

- Designed and developed responsive personal websites using HTML, CSS, and JavaScript, ensuring an optimized user experience across devices
- Implemented intuitive UI components and layouts with a focus on accessibility and performance optimization
- Collaborated with stakeholders to translate ideas into functional, visually appealing web interfaces
- Deployed projects to hosting platforms (e.g., GitHub Pages, Netlify), maintaining clean code and version control with Git/GitHub
